CALIBRATION CHART

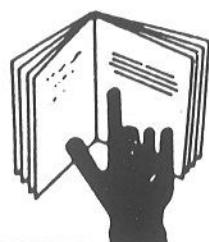

IRL

FERTILISER SPREADER

ZSB

PLEASE READ CAREFULLY
BEFORE USING THE MACHINE

ZSB-0193-A-IRL

ACCIDENT PREVENTION AND SAFETY ISSUES

1. Please observe the safety notes contained in this calibration chart as well as these in the operating instructions and all current statutory safety and accident prevention regulations! Warning and instruction decals provide essential information concerning safe operation - observe them for your own safety!
2. Please check all nuts, bolt and other fixings for tightness, especially those on discs and disc blades.
3. Before using the machine, operators must familiarise themselves with all parts of the equipment and the function of all controls and adjustments. Finding out during operation may be too late!
4. Before using the spreader for the first time check that the tractor/spreader combination is road worthy and in a safe operating condition.
5. Make sure that the weight of the spreader does not make the tractor unstable. In many cases it will be necessary to add suitable weights to the front of the tractor so that tractor/spreader stability steering and safety (and braking and traction for 4WD tractors) is not affected by the weight of the fully laden spreader. Observe maximum axle weight and permissible gross laden weight of the tractor.
6. The maximum payload of the ZSB fertiliser spreader is 1800kg. For easy reference the densities (weight per litre) of different fertiliser types are listed in the calibration charts.
7. Before filling the hopper with fertiliser make sure the working slide is in the closed position and that the motor engine is shut-off. Pull out ignition key.
8. Keep the hopper free of any foreign matter.
9. Only start the fertiliser spreader when all safety devices and guards have been properly fitted.
10. Before adjusting, lubricating, cleaning or carrying out any operation on the machine, switch off the PTO drive, switch off the tractor engine and wait until all moving parts have come to a complete stop. Disconnect PTO shaft.
11. Keep hands feet and clothing well away from moving parts. Do not put your hands into the hopper. It contains a rotating auger! Do not wear loose clothing!
12. In the event of a mechanical, hydraulic or electrical breakdown during operation, switch off the spreader immediately. Stop tractor engine and remove the ignition key before checking and repairing damage.
13. Any defects on the PTO shaft/guards must be repaired before the fertiliser spreader is used.
14. Before leaving the tractor unattended, lower the spreader to the ground, switch off engine and remove ignition key.

15.

ATTENTION! DANGER FROM FERTILISER!

Improper selection and use of fertilisers can have serious effects on people, animals, plants and on the environment in general.

Always select the correct fertiliser for your application. Always handle with care. Obey the fertiliser manufacturer's instructions to the letter.

THE SPREADER

es given in the calibration chart are derived from practical tests in the test spreader settings were achieved with fertiliser in perfect condition from pective manufacturer.

I particularly like to emphasize the fact that physical characteristics of ferti- n vary - even within the same type and brand - due to differences in qua- ranules, density, size of particles, texture of particles etc.

These variations in the fertiliser can influence the spreading characteristics quite markedly and, as a result, you may find that the fertiliser application rate may differ slightly from the rates predicted by the calibration charts.

The data provided in the calibration chart cannot be totally relied upon and, therefore, to ensure accuracy the machine should be recalibrated for appli- cation rate and spread pattern in every case.

ot guarantee that your fertiliser has the same spreading characteristics as iliser tested in our plant even if it is from the same manufacturer and of the pe. In order to achieve the desired spread pattern it may therefore be ry to change to a different setting if flow characteristics of the fertiliser pplied vary from that of the fertilisers we have tested. Careful calibration of ings on long test runs is always more accurate than guess work.

before recommend you to use only granular fertilisers from well known ma- rers and if possible only those fertilisers listed in our calibration charts. some types of fertilisers be missing from the charts please let us know.

SPREADING UREA: This highly concentrated nitrogen fertiliser is, due to its importation from various sources, extremely variable in quality. Different spreader settings to those given in our charts may therefore be required. Please also note the higher wind sensitivity of urea.

ecially careful when setting the machine. Even minor adjustment errors can re- a substantial deterioration of the spread pattern. We would particularly like to ut that no liability for consequential losses due to spreading errors can be d (see point avoiding spreading errors).

ESSENTIAL TIPS ON SPREADING

AVOIDING SPREADING ERRORS!

The modern design and quality construction of RAUCH fertiliser spreaders, together with extensive and continuous testing in our own factory test facility, we have created the pre-requisites for perfect, precision spread patterns.

Despite the careful production of our spreaders, and even with proper use, the possibility of variations in flow rate, and even total blockages, cannot be totally excluded. Such circumstances can, for instance, be caused by the following:

- Variable consistency of fertiliser and seeds (eg. distribution of particle sizes, densities, granule shape)
- lumpy and damp fertiliser
- wind-drift
- blockage or bridging (eg. foreign material, pieces of bag, moist fertiliser....)
- humps and dips in the field
- wear of wearing components (eg. auger, agitators, disc blades, outlets).
- accident damage
- lack of cleaning or corrosion prevention
- incorrect PTO speed or tractor forward speed
- fitting of incorrect discs (or mistaking l.h. and r.h. discs)
- missing out the calibration check
- incorrect fertiliser spreader height settings (not setting spreader pitch as per calibration chart)
- loose linkage check chains or spreader not level when viewed from rear

Therefore it is very important that you check that your fertiliser spreader is functioning correctly and accurately before every job and even during the job.

All claims for consequential losses, which have not been caused to the fertiliser spreader itself, are excluded from the manufacturer's liability. This includes any liability for consequential losses due to spreading errors. Any unauthorised alterations to the spreader may result in consequential losses which are excluded from the liability of the supplier.

In case of deliberate action or gross negligence of the owner or one of his employees, and in cases where the fault of the object of supply is covered by product liability for personal or physical loss, the liability exclusion of the supplier does not apply. The exclusion does also not apply in the absence of characteristics which have been expressly assured, and when these assurances were given precisely for the use of assuring the user against losses which have not been caused on the object of supply itself.

FAULT DIAGNOSIS AND TROUBLE SHOOTING

- **Uneven distribution of fertiliser**
 - Remove any fertiliser build up from discs, disc blades and outlet channels.
 - Check correct disc selection according to calibration chart. Check discs are correctly seated (note l.h. and r.h. side).
- **Too much fertiliser deposited around tractor tracks**
 - Check disc blades and outlet. Replace all defective components immediately.
- **Excessive fertiliser in overlapping zone**
 - The fertiliser has a coarser surface than the fertiliser tested for the calibration chart.
 - PTO speed is higher than that shown on the tractor tachometer. Have PTO shaft speed checked.
- **Spreader applies different amount on left hand and right hand sides.**
 - Check slide openings (see point 4.).
- **Fertiliser trickles from hopper with slide closed**
 - Check clearance between lower edge of agitator and hopper floor. If greater than 1 mm, shim hopper supports to compensate.
- **Chattering discs**
 - Check tightness and threads of plastic cap nuts and possibly replace.

FAULTS IN HYDRAULIC SLIDE OPERATION

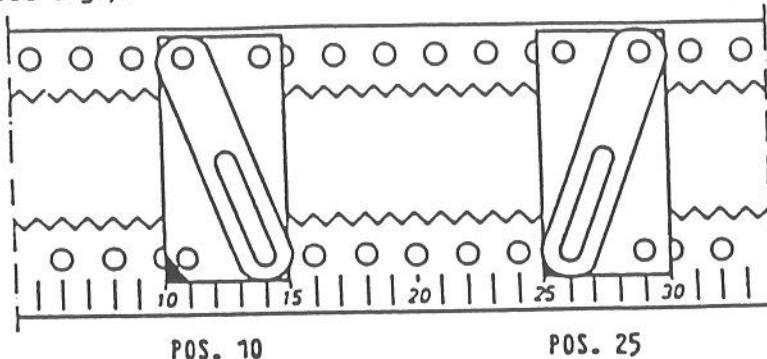

- **Lift ram fails to open.**
 - Slides too tight. Free slide, lever and joints. If necessary free leaf springs on adjusting levers through removal of rivets.
- **Lift ram opens too slowly.**
 - Oil is too thick. Drill out flow limiter to 1 mm or exchange (request to factory). In order to gain access to the flow limiter, unscrew fixing nut of pressure hose on ram inlet port (top connection in double acting rams).

SETTING THE OUTPUT

Setting the output on the ZSB spreader is made easy and safe by using the large scale.

Using the calibration chart select the scale setting corresponding to the required tractor speed and application rate. Set the end-stop on the adjuster segment to this value (grey edge on one of the 39 setting points).

When adjusting the end-stop by 1 hole, the stop position changes by 2 scale points. To adjust by 1 scale point only, turn the pull handle on the end-stop and lock into the offset holes (see fig.).

ATTENTION:

Rate setting using remote control with

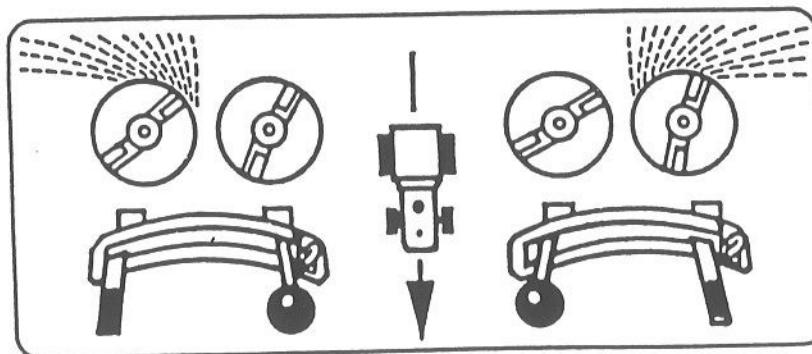

- a) 1 ram: set 1 position less
- b) 2 rams: set 2 positions less

than figure given in the calibration chart.

When the tractor has reached the required PTO speed open both slide levers to their end-stops to start spreading.

SINGLE SIDED SPREADING

When spreading to the right or left, disconnect the operating levers by pulling on the round control lever and then fully open the appropriate slide lever for the side you wish to spread.

1. Operate round control lever: spreading to the right only.
2. Operate rectangular control lever: spreading to the left only.

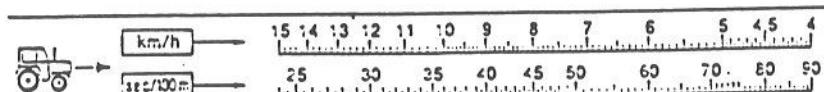

CALIBRATION CHECK

To ensure an accurate application rate we recommend that a new static calibration test is carried out each time a new type or batch of fertiliser is used. The calibration check is carried out with PTO operating and tractor standing still.

Calculation of exact tractor speed:

To calculate the tractor speed precisely, drive along a measured 100m on a field with the hopper half full and measure the time taken.

Tractor speed

Tractor speeds not shown on the above scale can be calculated using the following formula:

$$\text{Tractor speed} = \frac{360}{\text{measured time for 100m}}$$

Example: $\frac{360}{36\text{sec}} = 10\text{km per hr.}$

To determine the required output per minute:

The calibration check is usually only carried out on the left hand outlet. However the fertiliser quantity required is calculated for both outlets (total working width), ie. calculated quantities must be halved.

$$\text{kg/min} = \frac{\text{Tractor speed (km/h)} \times \text{working width in m} \times \text{application rate (kg/ha)}}{600}$$

Imperial calculation:

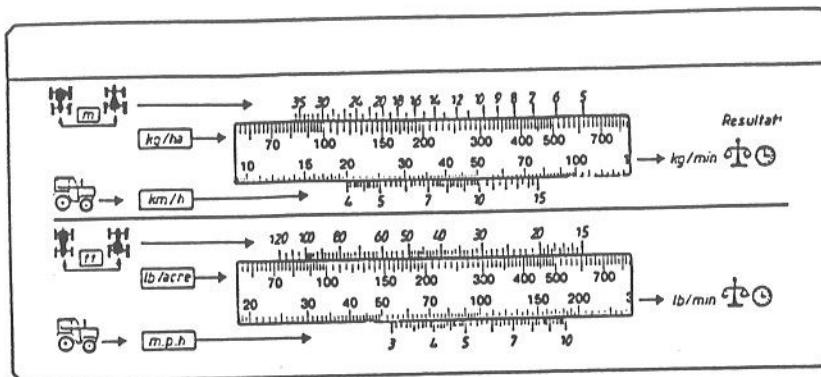

$$\text{lbs/min} = \frac{\text{Tractor speed (mph)} \times \text{working width (ft)} \times \text{appl. rate (lbs/acre)}}{495}$$

$$\text{Example: } \frac{7.5\text{km/h} \times 18\text{m} \times 360\text{kg/ha}}{600} = 81 \text{ kg/min}$$

Therefore 40.5 kg of fertiliser must be deposited through one outlet in one minute. Several attempts may be necessary before you find the correct aperture setting (use values provided in the charts as a guideline).

Application rate figures for a selection of outputs and tractor speeds are provided in the calibration chart.

This calculation can also be carried out using a calibration slide rule (optional equipment). For instance, if you position the 200kg/ha mark against 15m on the working width scale and then read the value for kg/min off above 8km/ha on the speed scale you get 40kg/min as the required fertiliser flow rate from both outlets.

LATE-TOP DRESSING

Special discs for late-top dressing are offered as optional equipment. These have been specially developed for this type of work and the type of fertiliser used.

Do not confuse left and right discs. (in the direction of travel) The marks L (left) and R (right) are stamped on the bottom of the discs and corresponding blades. Also note the designations NA, NB, SA, SB, etc.

Precise centering of disc on hubs is essential.

Place plastic cap nuts onto disc and turn counter clockwise in order to locate the thread. Then tighten clockwise. Do not cross thread! Lightly tighten plastic cap nuts using screw driver or steel strip. Do not overtighten!

Replace defective plastic cap nuts immediately (damaged thread, cracks, breakages).

ATTENTION! Discs are fast rotating components - hence DANGER!

The nut is prevented from working loose by means of a lock-nut. Check plastic cap nut after the first hour of operation for tightness. We recommend that the thread of the steel hub is lightly greased occasionally.

Mount the fertiliser spreader on the tractor as per measurements given in the calibration chart. Obtain application rate from calibration chart for normal spreading.

If the spreader cannot be set to the height stated, the lower 3-point link pins can be set in the lower positions thereby giving 140 mm additional height.

IMPORTANT:

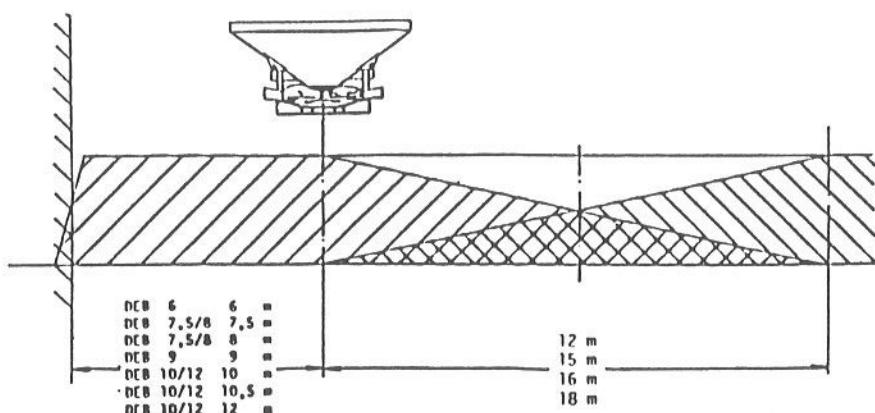

If the setting of linkage results in PTO shaft angle exceeding 25°, use a wide angle PTO shaft. Obtain application rate from calibration chart for normal spreading.

SPREADING ON HEADLANDS

In order to allow precise spreading on field headlands and boundaries, RAUCH offers boundary spreading equipment, spreading shields or headland discs as optional equipment. These avoid spreading fertiliser into hedgerows or under-application on field edges.

BOUNDARY SPREADING WITH BOUNDARY DISC "DEB" (both slides open)

For use with tramlines.

MAXIMUM PAYLOAD

The maximum payload of the ZSB spreader is 1800 kg. Any load greater than that voids your guarantee cover.

The load can be determined without a weighbridge by calculation using the density of the fertiliser. Weigh precisely 1 litre of fertiliser, giving the density in kg/litre.

Check the density of your fertiliser before loading the hopper.

The following guidelines may help:

- approx. 0,8 urea
- approx. 1,0 KAS
- approx. 1,2 NPK, Kali-fertiliser
- approx. 1,4 Kieserit, phosphate-fertiliser

The density of those fertilisers listed in the calibration chart can be found in the top field of the chart.

The following load limits must be adhered to for all ZSB spreaders:

ZSB 900: 900 l - 1800 kg Normal loading of hopper.

ZSB 1100: 1100 l - 1800 kg
0.8 kg/l - 1.3 kg/l
1,6 kg/l

Normal loading of hopper.
Normal loading of hopper.
Load hopper to only 85 %

ZSB 1500: 1500 l - 1800 kg	Normal loading of hopper.
0.8 kg/l - 1.2 kg/l	Load hopper to just under filling edge.
1.3 kg/l	Load hopper to only 75%.
1.6 kg/l	

ZSB 1800: 1800 l - 1800 kg
 0.8 kg/l - 1.0 kg/l Normal loading of hopper.
 1.3 kg/l Load hopper to only 75%.
 1.6 kg/l Load hopper to only 65%.

ATTENTION!

Fertiliser Density Varies With Type, And Even Different Batches Of The Same Material. It Is Therefore Absolutely Essential That The Machine To Spread The Fertiliser Is Checked, To Ensure That The Correct Setting Is Chosen To Deliver The Precise Weight Of Fertiliser In A Given Time.

The Charts In This Book Are Only Intended To Provide A Guide To The Setting Required. The Figures Were Calculated By Testing A Machine With The Aid Of A Computer Using Representative Samples Of Fertilisers Etc. This Is No Guarantee That Your Material Is Of The Same Type Or Density Or Has The Same Handling Characteristics.

Short Blade Position:

When spreading with the outlet levers set for any of the positions given in the above chart, the short blade on both left and right hand discs should be adjusted and secured in position 1.

These charts should be used as a guide only.
Variations/differences can occur in the material
being spread.
